CS360 - Assignment 2

2.3-5 Binary Search

```
Binary_Search(A, v, low, high)
                                             // Still elements to check
if low <= high
    mid = (low+high)/2
                                             // Get midpoint of remaining elements
     if v = A[mid]
          return mid
                                             // We found it!
     if v < A[mid]
          return Binary_Search(A, v, low, mid-1)
                                                    // Discard lower half
     else
          return Binary_Search(A, v, mid+1, high)
                                                    // Discard upper half
                                             // Bummer - element not found!
return nil
```

Intuitively we see that the worst case behavior occurs when the element is not in the array. In this case, the recursion will continue to execute cutting the array in half until $\frac{n}{2k} = 1 \Rightarrow k = \lg n$. Since the function body is $\Theta(1)$, i.e. there are no loops in it, the worst case run time would be $T(n) = (\lg n)\Theta(1) = \Theta(\lg n)$. However this is **not** a *proof* of the run time. Instead, we must construct the recursive equation and solve it via the Master theorem. Since at each pass we cut the number of elements into a single half with constant time operations at each pass (simply a comparison and computation of the next midpoint), the recursive equation is given by:

$$T(n) = T(n/2) + \Theta(1)$$

Applying the master theorem with a = 1, b = 2 and $f(n) = \Theta(1) = c$ gives $\log_b a = \log_2 1 = 0 \Rightarrow n^{\log_b a} = n^0 = 1$. Therefore we are in case 2 hence the solution is given by $T(n) = \Theta(n^{\log_b a} \lg n) = \Theta(\lg n)$.

3-2

			O	0	Ω	ω	Θ
a.	$\lg^k n$	n^{ϵ}	Y	Y	N	N	N
b.	n^k	c^n	Y	Y	N	N	N
c.	\sqrt{n}	$n^{\sin(n)}$	N	N	N	N	N
d.	2^n	$2^{n/2}$	N	N	Y	Y	N
e.	$n^{\lg c}$	$c^{\lg n}$	Y	N	Y	N	Y
f.	$\lg(n!)$	$\lg(n^n)$	Y	N	Y	N	Y

```
a. Since \lg^k n = o(n^a) (logs are bounded by polynomials) \Rightarrow \lg^k n = O(n^a) (i.e.
```

Also if
$$\lg^k n = o(n^a) \Rightarrow \lg^k n \neq \omega(n^a)$$
 (i.e $<\Rightarrow \not>$)
Likewise $\lg^k n = o(n^a) \Rightarrow \lg^k n \neq \Omega(n^a)$ (i.e $<\Rightarrow \not\geq$)
Finally since $\lg^k n \neq \Omega(n^a) \Rightarrow \lg^k n \neq \Theta(n^a)$ (i.e $<\Rightarrow \not\neq$)

b. Since $n^k = o(c^n)$ (polynomials are bounded by exponentials) By similar argument as above $\Rightarrow n^k = O(c^n)$ (i.e. $< \Rightarrow <$) $n^k \neq \omega(c^n)$ (i.e $\iff \gg$)

```
n^k \neq \Omega(c^n) (i.e \iff \geq)
n^k \neq \Theta(c^n) (i.e \iff \neq)
c. Since \sin n takes on values in the range [0,1] periodically \Rightarrow n^{\sin n} takes on
values [n^0, n^1] = [1, n] periodically However since 1 \le \sqrt{n} \le n for all n, \Rightarrow \sqrt{n}
is never always <, >, or = n^{\sin n} for all n \ge n_0
\Rightarrow \sqrt{n} is not asymptotically bounded by n^{\sin n}.
d. Using the limit test for \omega on pg. 48, we can easily show that
\lim_{n\to\infty} \frac{2^n}{2^{n/2}} = \lim_{n\to\infty} 2^{n/2} = \infty
\Rightarrow 2^n = \overline{\omega}(2^{n/2})
Using a reverse argument as (a) gives \Rightarrow 2^n = \Omega(2^{n/2}) (i.e. > \Rightarrow \geq)
2^n \neq o(2^{n/2}) (i.e \Rightarrow \neq)
2^n \neq O(2^{n/2}) (i.e \Rightarrow \not\leq)
2^n \neq \Theta(2^{n/2}) (i.e \Rightarrow \neq)
e. By equation 3.15, n^{\lg c} = c^{\lg n}, so by the reflexive property
n^{\lg c} = \Theta(c^{\lg n}) \ n^{\lg c} = \Omega(c^{\lg n}) \ n^{\lg c} = O(c^{\lg n})
Since n^{\lg c} = \Theta(c^{\lg n})
\Rightarrow n^{\lg c} \neq o(c^{\lg n}) (i.e. = \Rightarrow \not <) and n^{\lg c} \neq \omega(c^{\lg n}) (i.e. = \Rightarrow \not >)
f. Since \lg(n^n) = n \lg n from equation 3.18 \Rightarrow \lg(n!) = \Theta(n \lg n) which by the
theorem gives \lg(n!) = O(n \lg n) \ (= \Rightarrow \leq) and \lg(n!) = \Omega(n \lg n) \ (= \Rightarrow \geq)
Similarly to part (e) \lg(n!) \neq o(n \lg n) \ (=\Rightarrow \not<) and \lg(n!) \neq \omega(n \lg n) \ (=\Rightarrow \not>)
```

 $\Rightarrow T(n) = \Theta(n^{2.81})$

4-1 b T(n) = T(7n/10) + n choose a = 1 b = 10/7 f(n) = nThen $log_b a = log_{10/7} 1 = 0 \Rightarrow n^{log_b a} = n^0 = 1$ $f(n) = n = \Omega(n^{0+\epsilon})$ for $\epsilon \le 1$ so possibly case 3. Checking regularity $1(\frac{n}{(10/7)}) = \frac{7}{10}n \le cn$ for $\frac{7}{10} \le c < 1$ so choose $c = \frac{4}{5}$ (or any other value in the given range.) $\Rightarrow T(n) = \Theta(n)$ c. $T(n) = 16T(n/4) + n^2$ choose a = 16 b = 4 $f(n) = n^2$ Then $log_b a = log_4 16 = 2 \Rightarrow n^{log_b a} = n^2$ $f(n) = n^2 = \Theta(n^2)$ so case 2. $\Rightarrow T(n) = \Theta(n^2 \lg n)$ d. $T(n) = 7T(n/3) + n^2$ choose a = 7 b = 3 $f(n) = n^2$ Then $log_b a = log_3 7 = 1.77 \Rightarrow n^{log_b a} = n^{1.77}$ $f(n) = n^2 = \Omega(n^{1.77+\epsilon})$ for $\epsilon \leq .23$ so possibly case 3. Checking regularity $7(\frac{n}{3})^2 = \frac{7}{9}n^2 \le cn^2 \text{ for } \frac{7}{9} \le c < 1$ $\Rightarrow T(n) = \Theta(n^2)$ e. $T(n) = 7(n/2) + n^2$ choose a = 7 b = 2 $f(n) = n^2$ Then $log_b a = log_2 7 = 2.81 \Rightarrow n^{log_b a} = n^{2.81}$ $f(n) = n^2 = O(n^{2.81 - \epsilon}) \text{ for } \epsilon \le .81 \text{ so case } 1.$

```
4-3a T(n) = 4T(n/3) + n \lg n

choose a = 4 b = 3 f(n) = n \lg n

Then log_b a = log_3 4 = 1.26 \Rightarrow n^{log_b a} = n^{1.26}

f(n) = n \lg n = O(n^{1.26 - \epsilon}) for \epsilon \le .26 (since all logs are upper bounded by all polynomials) so case 1.

\Rightarrow T(n) = \Theta(n^{1.26})
```
